Executive Strategy Brief V2.3

The Algorithm Commercial Growth Architecture

CEO Brief | 5-minute read

Evidence-led strategy. No revenue forecast. Internal validation required where noted.

The opportunity

The Algorithm already has multiple commercial assets: three product engines, regulated engineering capability, managed infrastructure, existing client relationships and multiple target geographies. The next commercial step is not simply 'more sales activity'. It is a disciplined system for choosing accounts, proving business value, converting opportunities and expanding relationships.

1. The operating thesis

- Products create low-friction entry.
- Implementation exposes adjacent customer problems.
- Regulated engineering creates depth.
- Managed infrastructure creates continuity.
- Customer success and account intelligence create expansion.

2. How the commercial system works

Step	Output
UNDERSTAND	Product/service truth, ICP and proof boundaries
PRIORITIZE	Markets, verticals and account tiers
IDENTIFY	Verified corporate trigger and account hypothesis
ENGAGE	Value-first executive outreach
DIAGNOSE	Business impact, critical event and economic case
CONVERT	Technical validation, MEDDPICC, proposal and close
EXPAND	Modules, sites, workflows, engineering and managed services
RETAIN	Success governance, renewal and strategic-account development

3. Where I would focus first

Engine	First commercial wedge
clinIQ	Clinic operations assessment around patient flow, intake, RTM/pre-auth or multi-site standardization
Regure	Claims/document workflow friction around Guidewire/Duck Creek or other core systems
SentienGuard	Infrastructure autonomy assessment for repetitive SRE/on-call work
Regulated Engineering	Surgical-strike modernization, production AI, compliance architecture or regulated cloud problem

4. How I would avoid random outbound

- No trigger, no Tier A.

- Every account plan distinguishes Fact -> Hypothesis -> Discovery Question.
- 100-point score: Fit 25, Trigger 25, Pain 20, Access 15, Expansion 15.
- Existing clients and partner ecosystems are researched alongside new-logo accounts.

5. How I would sell

No demo before diagnosis

SPICED diagnoses the business problem and critical event. MEDDPICC inspects enterprise deal quality. Challenger principles help reframe status quo. SPIN can support lighter product discovery. SentienGuard adds Product-Qualified Account signals.

Pipeline stage	What must be true
1 Qualified Problem	Verified problem, owner, reason now, customer next step
2 Business Case Validated	Baseline, impact, critical event, economic buyer/champion
3 Solution & Technical Validation	Scope, technical/security fit, acceptance criteria, buying process
4 Commercial Commitment	Proposal, economic review, procurement/legal path, signature date
5 Closed / Implementation	Signed agreement, implementation owner, baseline and success measures

6. What I would own

- Market strategy, ICP, account intelligence, prospecting and executive outreach.
- Discovery, business cases, solution alignment, proposals, negotiation and closure.
- Implementation handoff, customer success, account expansion and partnerships.
- Product-market feedback, win/loss intelligence and commercial operating discipline.

7. 180-day execution

Days	Focus
1-30	Validate current customers, pipeline, proof, pricing, ICP and priorities
31-60	Build account/trigger database, messaging, value assets and pipeline discipline
61-90	Create qualified conversations, discoveries, assessments and early proposals
91-120	Move qualified opportunities through business/technical/commercial validation
121-150	Expand existing accounts, create proof and refine vertical plays
151-180	Systemize the motions that work and recommend the next commercial phase

8. What success means before revenue is predictable

- Better account selection, stronger executive conversations and measurable discovery quality.
- Qualified business cases, pilots/assessments, proposals and opportunities progressing through explicit stage criteria.
- Existing-account expansion hypotheses and partner routes.
- A repeatable, evidence-led commercial system rather than activity for activity's sake.

Close

The next stage is not about doing more sales activity. It is about building a commercial system that knows where to focus, why a customer should act, how to prove value and how to grow the relationship after the first win.

9. Enterprise entry and account-value expansion

The products should not be sold as cheap subscriptions. The public package is only the commercial starting point. The enterprise motion is to enter around a contained problem, prove value, and expand when the customer's operating scale or complexity creates a larger requirement.

Product	Entry	Enterprise growth logic
clinIQ	Clinic Operations & Revenue Assessment / contained workflow or site	Scale through patient volume, sites/providers, modules, pre-auth, EHR/API integration and enterprise SLA/support; then introduce healthcare engineering only when requirements exceed the product.
Regure	Guided pilot / one claims or document workflow	Current pricing is per-user, but account value also expands through workflows, LOBs, custom APIs, private cloud, governance and enterprise support.
SentienGuard	Technical validation on free/Team endpoints	Use product-qualified signals to expand endpoints/environments, then Fleet/MSP for multi-tenancy, custom RBAC, extended audit retention and 24/7 support; recurring root issues can open cloud/managed-infrastructure conversations.

Executive principle: Entry pricing lowers friction. Enterprise value grows when customer scale, complexity, governance, integration and operational ownership increase.
