

# Regulated Engineering GTM Playbook V2.2

Compliance-native engineering, modernization and managed infrastructure

**V2.2 Research Edition**

*Evidence-led strategy. No revenue forecast. Internal validation required where noted.*

### Executive understanding

The Algorithm should not be sold as a generic developer bench. Its current public proposition is senior, domain-qualified, compliance-native engineering delivered around defined outcomes. Fixed-price/fixed-scope and full IP transfer can be meaningful differentiators when the problem boundary is clear.

## 1. Positioning

- Primary message: outcome, not capacity.
- Commercial wedge: technically difficult, regulated and expensive-to-get-wrong problems where architecture, compliance and operational risk cannot be separated.
- Staffing/resource augmentation can be an entry when urgency demands it, but should not define the whole proposition.

## 2. Priority surgical-strike plays

| Play                                    | Trigger                                                                            | Buyer                 | Entry offer                                      |
|-----------------------------------------|------------------------------------------------------------------------------------|-----------------------|--------------------------------------------------|
| Enterprise Modernization                | Failed implementation, end-of-life stack, migration delay, acquisition integration | CIO / CTO             | Modernization Triage & Recovery Assessment       |
| Production AI / AI Platform Engineering | AI pilot blocked before production, regulated data, governance risk                | CTO / CDO / BU leader | Production AI Readiness Sprint                   |
| Compliance Architecture                 | Audit findings, new regulation, market expansion, manual evidence                  | CISO / Risk / CTO     | Compliance Architecture Review                   |
| Regulated Cloud Migration               | Cloud mandate with residency/security constraints                                  | CIO / Cloud leader    | Regulated Cloud Migration Blueprint              |
| Agentic AI Engineering                  | High-value multi-step workflows, agentic initiative                                | CTO / COO / CDO       | Agentic Workflow Discovery                       |
| Managed Infrastructure                  | On-call burden, MSP dissatisfaction, recurring reliability work                    | CIO / VP Infra / COO  | Infrastructure Autonomy & Managed Ops Assessment |

## 3. Competitive frame

| Model                   | Why buyers choose it                      | Structural trade-off                                   | Algorithm wedge                                          |
|-------------------------|-------------------------------------------|--------------------------------------------------------|----------------------------------------------------------|
| Global SI               | Brand, procurement access, breadth, scale | Large programs, complex staffing pyramids, broad scope | Contained high-risk problem with senior accountable team |
| Large offshore services | Scale and cost leverage                   | Utilization/headcount economics may dominate           | Outcome ownership and compliance-native architecture     |
| Boutique engineering    | Agility and seniority                     | May lack regulated-industry breadth                    | Domain + compliance + production handover                |
| Staff augmentation      | Fast capacity                             | Customer owns architecture and delivery risk           | Use only when capacity is the real problem               |

| Model         | Why buyers choose it         | Structural trade-off                        | Algorithm wedge                               |
|---------------|------------------------------|---------------------------------------------|-----------------------------------------------|
| Internal team | Control and domain knowledge | Capacity, legacy bias, competing priorities | Specialist intervention with full IP handover |

## 4. Compliance-by-architecture moat

- Compliance should enter before implementation: identity, access, encryption, data residency, logging, lineage, network segmentation, change control, backup/recovery and incident evidence.
- Turn regulation into engineering IP through reusable architecture patterns, infrastructure-as-code controls, requirement-to-control mapping and evidence generation.
- Do not claim that a generic agency is inherently non-compliant. The defensible argument is that treating compliance as a downstream review can increase remediation and audit risk.

## 5. Fixed price vs T&M

| Dimension          | T&M                                     | Fixed-price / fixed-scope model                          | CFO implication                                             |
|--------------------|-----------------------------------------|----------------------------------------------------------|-------------------------------------------------------------|
| Budget             | Spend rises with hours                  | Commercial boundary agreed in advance                    | Higher initial cost visibility                              |
| Delivery incentive | Supplier revenue can rise with duration | Supplier manages effort inside scope                     | More delivery-efficiency risk sits with provider            |
| Scope              | Flexible but can drift                  | Explicit assumptions/exclusions                          | Requires disciplined change control                         |
| Discovery          | Often billable                          | Current Algorithm positioning says no discovery retainer | Less pre-delivery spend if scope can be responsibly bounded |
| Finish line        | Can remain effort-based                 | Named milestones / production deliverable                | Clearer acceptance criteria                                 |

### Important

Fixed price does not mean zero risk. It works when scope, access, dependencies, acceptance criteria and change control are explicit.

## 6. Failed modernization recovery motion

- TRIAGE: identify what is salvageable.
- CONTAIN: stop further operational or financial damage.
- MAP COMPLIANCE: identify controls that must survive transition.
- REPLACE SELECTIVELY: use strangler/parallel patterns where appropriate.
- VALIDATE: test old/new behavior and control evidence.
- CUT OVER: execute with rollback and business continuity.
- HAND OVER: code, architecture, runbooks, infrastructure-as-code and evidence.

## 7. Trigger-based account scoring

| Score area | Weight | Evidence                                                                  |
|------------|--------|---------------------------------------------------------------------------|
| Fit        | 25     | Regulated vertical, complexity, geography, technology compatibility       |
| Trigger    | 25     | Official modernization/AI/compliance/cloud event with date                |
| Pain       | 20     | Economic/operational consequence with evidence                            |
| Access     | 15     | Named economic/technical/operational buyers and relationship path         |
| Expansion  | 15     | Logical path into adjacent engineering / managed infrastructure / product |

## 8. Business-case scoping

| Problem                | Inputs                                                                            | Model                                    |
|------------------------|-----------------------------------------------------------------------------------|------------------------------------------|
| Cost of delay          | Approved monthly contribution or quantified business consequence x months delayed | Use customer-approved business case only |
| Legacy maintenance     | Internal labor + vendor support + infra + incident remediation + contractors      | Annual current-state cost                |
| Failed implementation  | Sunk investment + remaining commitments + recovery cost + delay                   | Do not imply sunk cost is recoverable    |
| Compliance remediation | Engineering/risk hours + external specialists + duplicated audit effort           | Annual/incident-specific burden          |

## 9. Existing customer expansion

- Before new-logo prospecting, audit the approximately 10 existing services relationships mentioned in discussion.
- For each account capture: industry, current engagement, stakeholders, delivery value, upcoming initiatives, adjacent product fit, engineering fit, managed-infrastructure fit, executive question.
- Do not invent account-level cross-sell until client identities, scope and outcomes are known.

## 10. Commercial readiness

| Input required                                         | Why                                |
|--------------------------------------------------------|------------------------------------|
| Current service clients and referenceable outcomes     | Installed-base expansion and proof |
| Deal size / margin / delivery capacity                 | Commercial qualification           |
| Skills inventory and location capacity                 | Feasible promises                  |
| Hyperscaler / platform partnerships and certifications | Co-sell and procurement            |

| Input required                            | Why                    |
|-------------------------------------------|------------------------|
| Win/loss history                          | Positioning refinement |
| Proposal / SOW / change-control templates | Fixed-price discipline |

## 11. Real target-account intelligence examples

*These are research targets based on current public signals. They are not confirmed opportunities or evidence of buying intent.*

### Aster DM Healthcare, UAE

**Fact:** Aster announced AED 1 billion of UAE expansion in February 2026, including new hospital capacity and continuing digital/HIS and AI investment.

**Commercial hypothesis:** Expansion can create healthcare integration, data, cloud and compliance-engineering requirements beyond any single product implementation.

**Discovery question:** Which integration, data or infrastructure dependencies could become constraints as the new facilities and digital initiatives scale?

### Core42 / e& UAE

**Fact:** The July 2026 Sovereign AI Compute launch combines sovereign GPU infrastructure, secure connectivity and production AI deployment with explicit resilience and digital-continuity objectives.

**Commercial hypothesis:** The account is highly sophisticated, so a generic cloud-services pitch would be weak. A specialist regulated-engineering wedge would need to solve a precise production, resilience, integration or compliance problem.

**Discovery question:** Where does the current sovereign AI operating model still require specialist engineering beyond the platform and professional services already in place?
