

THE ALGORITHM

Building The Algorithm's Commercial Growth Engine

An outside-in leadership view of where I would focus, how I would create qualified traction and how commercial ownership could develop.

THE CONVERSATION

Not a website summary.
A discussion about choices.

- Where the strongest commercial leverage may exist
- What I would prioritize before scaling activity
- How I would connect acquisition, conversion and account growth
- What I would need to validate with leadership

The capability is broader than the current commercial motion.

The question is not whether there is something to sell. It is where to focus first and how to make growth systematic.

Product IP

Three distinct product entry points.

Regulated Engineering

A route into complex, regulated transformation.

Managed Infrastructure

A continuity layer when operational ownership is justified.

Existing Relationships

Earned trust that should be audited before chasing only new logos.

My starting point: choose the few problems and accounts where proof, urgency and expansion potential can compound.

I would not try to scale all four growth engines equally on day one.

The first phase should create commercial learning and proof, not maximum activity.

1	2	3	4
Audit what is already earned	Select the best entry motions	Build named-account intelligence	Create repeatable conversion
Existing customers, relationships, proof and expansion signals.	Prioritize products/services where buyer pain and proof can be tested quickly.	Use verified triggers and buyer maps instead of broad outbound volume.	Standardize discovery, business cases, technical validation and next-step discipline.

WHAT I WOULD NOT DO	Hire ahead of a proven motion, force cross-sell, forecast unsupported revenue, or treat meeting volume as commercial progress.
---------------------	--

Focus should follow evidence, not geography alone.

US and UAE are the initial priority markets; UK and India remain selective based on product applicability and account evidence.

Priority 1: US + UAE

- Look for verifiable operational, modernization, AI, cloud or compliance triggers
- Prioritize accounts with identifiable buyers and a contained first problem
- Use ecosystem routes where they improve credibility or access

Priority 2: UK + India

- Pursue selectively rather than by default
- Match the engine to market and regulatory applicability
- Let account-level evidence override generic market enthusiasm

Principle: Market opportunity tells us where to investigate. Triggers determine where we act.

The first commercial advantage is deciding where not to spend time.

A named account should earn attention through evidence, not fit an ICP on paper.

FIT

Is this the right type
of account?

TRIGGER

Why now?

PAIN

What may be
economically
meaningful?

ACCESS

Can we reach the
buying group?

EXPANSION

Can value
legitimately deepen?

DISCIPLINE

FACT → HYPOTHESIS → DISCOVERY QUESTION
No trigger, no Tier A. No evidence, no invented pain.

A good opportunity should become clearer as it moves forward.

The objective is not to advance stages. It is to reduce commercial uncertainty.

No demo before diagnosis. No proposal before quantified impact. No forecast without a critical event and buying process.

The first contract should create information about the next legitimate problem.

Expansion should be earned through implementation insight, customer outcomes and executive relevance.

Product expansion More modules, workflows, users, sites or operating scope.

Engineering depth Integration, data, AI, modernization or compliance needs exposed by delivery.

Operational continuity Managed infrastructure only where ongoing ownership becomes a real requirement.

Strategic relationship Customer success, executive reviews, retention and referenceability.

Cross-sell only when the next problem is visible. Capability alone is not a reason to sell.

The relevant pattern in my experience is translating business problems into commercial and delivery action.

These examples are intentionally anonymized and are not claims about The Algorithm.

Insurance / Enterprise Tech

Guidewire-related requirements

Discovery, solution/resource alignment, technical-commercial coordination

Laboratory / Testing

Workflow digitization

Workflow mapping, SaaS positioning, implementation discussions

Food / FMCG Quality

Quality + traceability

Digital workflow design, product collaboration, adoption

Energy Trading

Niche ETRM engineering

Requirement alignment, capability positioning, delivery coordination

AI / Enterprise Software

AI-enabled workflows

Opportunity shaping, AI/NLP positioning, technical-commercial coordination

I would own the commercial motion, not just the top of the funnel.

Technical leadership remains engaged where technical authority and company commitments matter.

Commercial ownership

- Market strategy and prioritization
- Account intelligence and outreach
- Discovery, qualification and business case
- Proposal coordination and negotiation
- Account growth and customer-success cadence
- Commercial intelligence and operating discipline

Technical leadership

- Architecture validation
- Roadmap commitments
- Security and compliance validation
- Custom-engineering estimation
- Major technical workshops
- Strategic executive sponsorship

The first six months should prove the motion and create a system that can scale.

The plan commits to evidence and operating discipline, not arbitrary revenue promises.

1-30	VALIDATE	Internal audit, customer/account review, product proof, pricing, ICP and installed-base map.
31-60	BUILD	Account intelligence, messaging, value assets, discovery structure and CRM discipline.
61-90	CREATE TRACTION	Executive conversations, discovery, assessments, workshops and qualified opportunities.
91-120	CONVERT	Business cases, pilots where justified, technical validation and commercial progression.
121-150	EXPAND	Existing-account expansion, cross-sell validation, case studies and win/loss learning.
151-180	SYSTEMIZE	Repeatable motions, governance, customer-success cadence and next-phase recommendation.

Discussion: What should we validate first, and where should commercial ownership begin?
